

EMBRACE A GENE-BASED PERSONALISED DIET AND LIFESTYLE TO OPTIMISE YOUR HEALTH AND WELLNESS

♀ dna oestrogen

Improving oestrogen metabolism is of benefit to women who suffer from oestrogen-dominant conditions such as endometriosis, premenstrual syndrome and uterine fibroid tumors.

Are you aware that 80% of breast cancer occurs in women with no family history? Research has shown that an increased lifetime exposure to oestrogen is a strong risk factor in the development of breast cancer.

DNA Oestrogen tests for gene variants that have been shown to have an impact on how oestrogen is metabolized and therefore may help individuals' lessen the risk for developing breast cancer.

DNA Oestrogen reports on the following areas:

- Phase 1 detoxification
- Phase 2 detoxification
- Oxidative stress
- Personal risk factors associated with HRT, Oral contraceptives, bio-identical supplementation and in vitro fertilization
- Intervention strategies for at risk patients.
